My colleague and I had contact with the hotel manager riu,
to do an interview about the problem of waste management in aruba
, then we will argue that Mr. carson thinks about it.

The manager justin carson speaks to us about his personal impression as a professional here in
aruba, basically it has been the service and what has already been done by the waste management
company in aruba

He mentioned two companies here on the island that are: Ecotech and Serlimar.

Ecotech you have to have a great respect for what they have done and what they continue to do
for the environment, do what is necessary for aruba, for the earth and on the other hand to
become a total disaster in the sense that the dumb is only connects all toxic waste in the water
and all this goes to the ocean, with plastic sacks flying everywhere, tire burns, litter thrown all
over the place, many different gases in our atmosphere. the manager decided not to say anything
else about the dumb because in his opinion he clarified that the dump was a total mess. On the
other hand he gave us to understand that they as a company take 100% of the garbage and
remove it to the middle to separate part of the garbage and supposedly send it to the United
States to reduce the garbage and it makes sense because if we reduce as for example recycling
and then he thinks that on that part is fantastic because they take the rocks and leave for use with
a sister company, there is also another part that use it for organic waste where they crush and
reduce it for the cement factory.

this means that the organic waste is also sent to the web company and the sea to reduce the gases in the atmosphere from there that comes greenhouse that serves as gas reduction.

The desired future for the waste in aruba for Mr. Carson would be that all garbage will go around the processes that the ecotech company is doing. the public opinion of ecotech has not been in contact with the people there but they have said that basically they have a monopoly, a market, which is very powerful, in short, very bad that they left their personal beliefs about the environment But Mr. Carson would like to see all the garbage fence in this process something he forgot to mention and that is that after ecotech has finished reducing, we have 100% of the garbage and less than 10% that becomes minerals. in the future you would like to see 100% that all the garbage go to this process before it goes to the dump.

The obstacles that have been in the way to reach this desired future have been nothing more and nothing less than fortunately have been the policies claim.

people who have not wanted much power and more when they are doing their job very well Mr. carson clarified that ecotech on that side is losing enough money trying to recycle for years...then the obstacles would be people and those who are not believers when recycling.

The Market for Improved Waste Management in Aruba believes that it should be a law to make a fund market for people on ecotech to know what to do, the well done, as government should find more pollution and less waste that has been working in the environment because for that reason it should become a law for this process. this was his personal belief..

The manager of the Hotel Riu Aruba wanted to add one more point on the subject they do not work, they are not in conjunction with certain issues on waste management as batteries, should

have specific devices for batteries and other things that have much to do and other toxic tools, all are thrown away and at the end they are collected by the ecotech company and good because once it has been bought after it has been exposed on the floor and when it rains it goes and runs into the ocean, then ecotech has to provide So, well, having to use vegetables and depress oil, all this must be done in the local company that is fantastic, it is called ATS energy, they collect the used oil and then create arubus the plus or minus 5% of foils needed for this should be promised and that law be made what is right for the environment.
